

Contract Review Copilot —

Submission Summary & Quick Start

This package contains the **SecureFlow Contract Copilot**, an interactive React-based legal tech application that automates corporate NDA and customer order form audits, classifies pipeline backlogs, and flags critical compliance and geopolitical risk exposures.

Key Architectural Capabilities:

- **Simulation Mode:** Offline parsing of geopolitical triggers, non-standard governing laws, and payment terms using pre-baked heuristics. Runs out-of-the-box.
- **Live API Mode:** Full support for Google Gemini, OpenAI ChatGPT (GPT-4o), Anthropic Claude 3.5 Sonnet, Microsoft Copilot, and local Ollama (LLaMA 3) models.
- **CORS Policy Fallback:** Automatic detection of browser CORS blocks, gracefully executing the heuristic engine to keep the user flow active.
- **Printable Audit Reports:** Memos and global backlog executive compliance reports suitable for printing or PDF exports.

Quick Start: How to Run

Follow these simple steps to run the interactive web application on your local machine:

Step 1: Open your terminal and navigate to the application folder:

```
cd contract-copilot
```

Step 2: Install project dependencies:

```
npm install
```

Step 3: Start the Vite development server:

```
npm run dev
```

Step 4: Open your browser and navigate to the provided local URL:

```
http://localhost:5173
```

How to Test and Verify

- **Drag-and-Drop Ingestion:** Drag and drop any PDF document from the `test_pdfs/` directory (located in the root folder) directly into the app dashboard.
 - `Compliant_NDA_Acme.pdf`: 0% risk score, compliant mutual NDA.
 - `Russia_Sanctions_NDA_RosTech.pdf`: 94% risk score, triggers geopolitical sanctions, Moscow forum, and unilateral indemnities.
 - `Unilateral_Indemnity_NDA.pdf`: 65% risk score, triggers unilateral indemnity.
- **Dashboard Filters:** Click on the metric cards at the top of the dashboard (e.g. "High Priority Risks") to filter the queue. Click the filter badge (✕) to clear it.
- **AI Engine Config:** Use the dropdown selector in the bottom-left corner to choose models. Input API keys (or local host endpoints for Ollama LLaMA 3) to test live API integrations.
- **Line-by-Line Diffs:** In the review workspace, examine differences against company templates, read agent execution logs, and click "Apply Redraft" to resolve red flags with one click.
